

**Technology and experience are
our strategic advantages for
discover the required resources
for the **Green Pact** and
achieve **decarbonization by 2050****

www.geoit.cl

Applications and services: UAV Photogrammetry

► Topography - Geology:

- UAV Photogrammetry for mapping and 3D digital terrain models (DEM)
- High-resolution orthomosaics.
- VNIR Multispectral Surveys.

► Precision Agriculture:

- Plant counting.
- Measurement of water stress and greenness index.
- 3D drainage mapping.
- Vegetation cover density.

► Included Services:

- Planning, design, and execution of lines acquisition through RTK-PPK drones.
- Baseline and Control Point Surveying with dual-frequency differential GPS.
- Our products provide ultra-high-resolution images and digital elevation models as invaluable tools for planning and analyze spatial data.

Orthomosaics

3D Models

Vigor Analysis

Volume Calculation

Applications and services: UAV Magnetometry

► Identification of magnetic anomalies:

- Recognition of geological and magnetic structures in PC. and Epithermal hydrothermal systems.
- Determination of geological boundaries.
- Geothermal exploration.

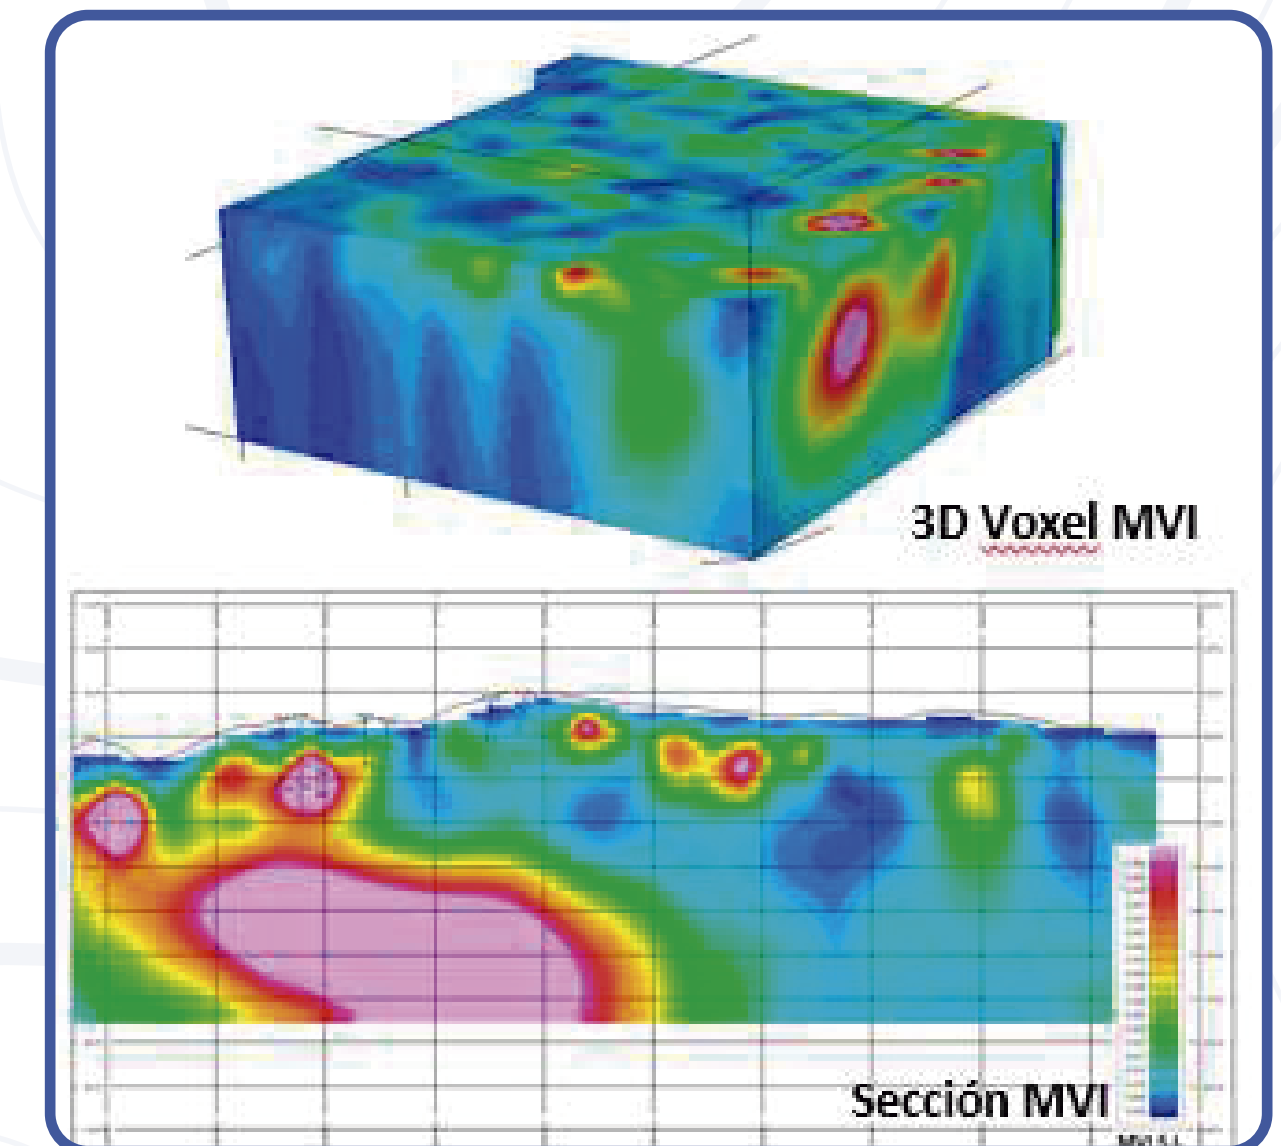

► Detection of UXOs and Metallic Objects

► Included Services:

- Planning, design and execution of acquisition lines.
- Generation of 2D maps: TMI, RTP, AS, 1DV.
- 3D Magnetic Vector inversion (MVI) and Self Organizing Map (SOM) inversion models.
- Integration of multiparameter geophysics for Machine Learning exploration models.
- Technical report and interpretation of results. Planning, design, and execution of acquisition lines using RTK-PPK drones.

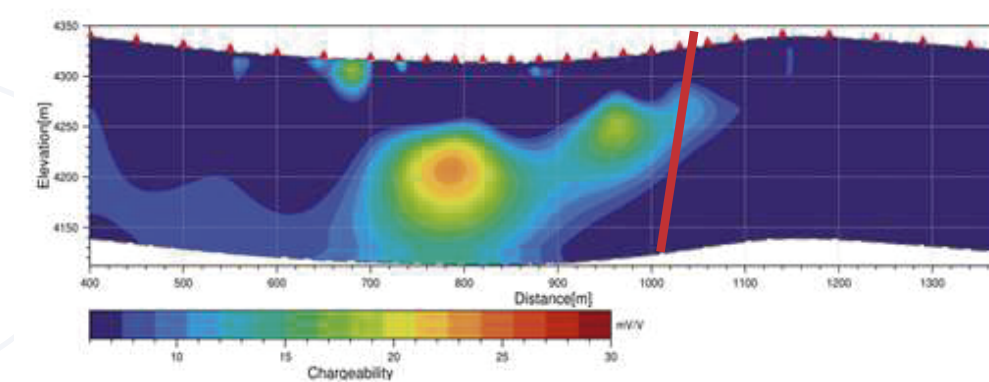

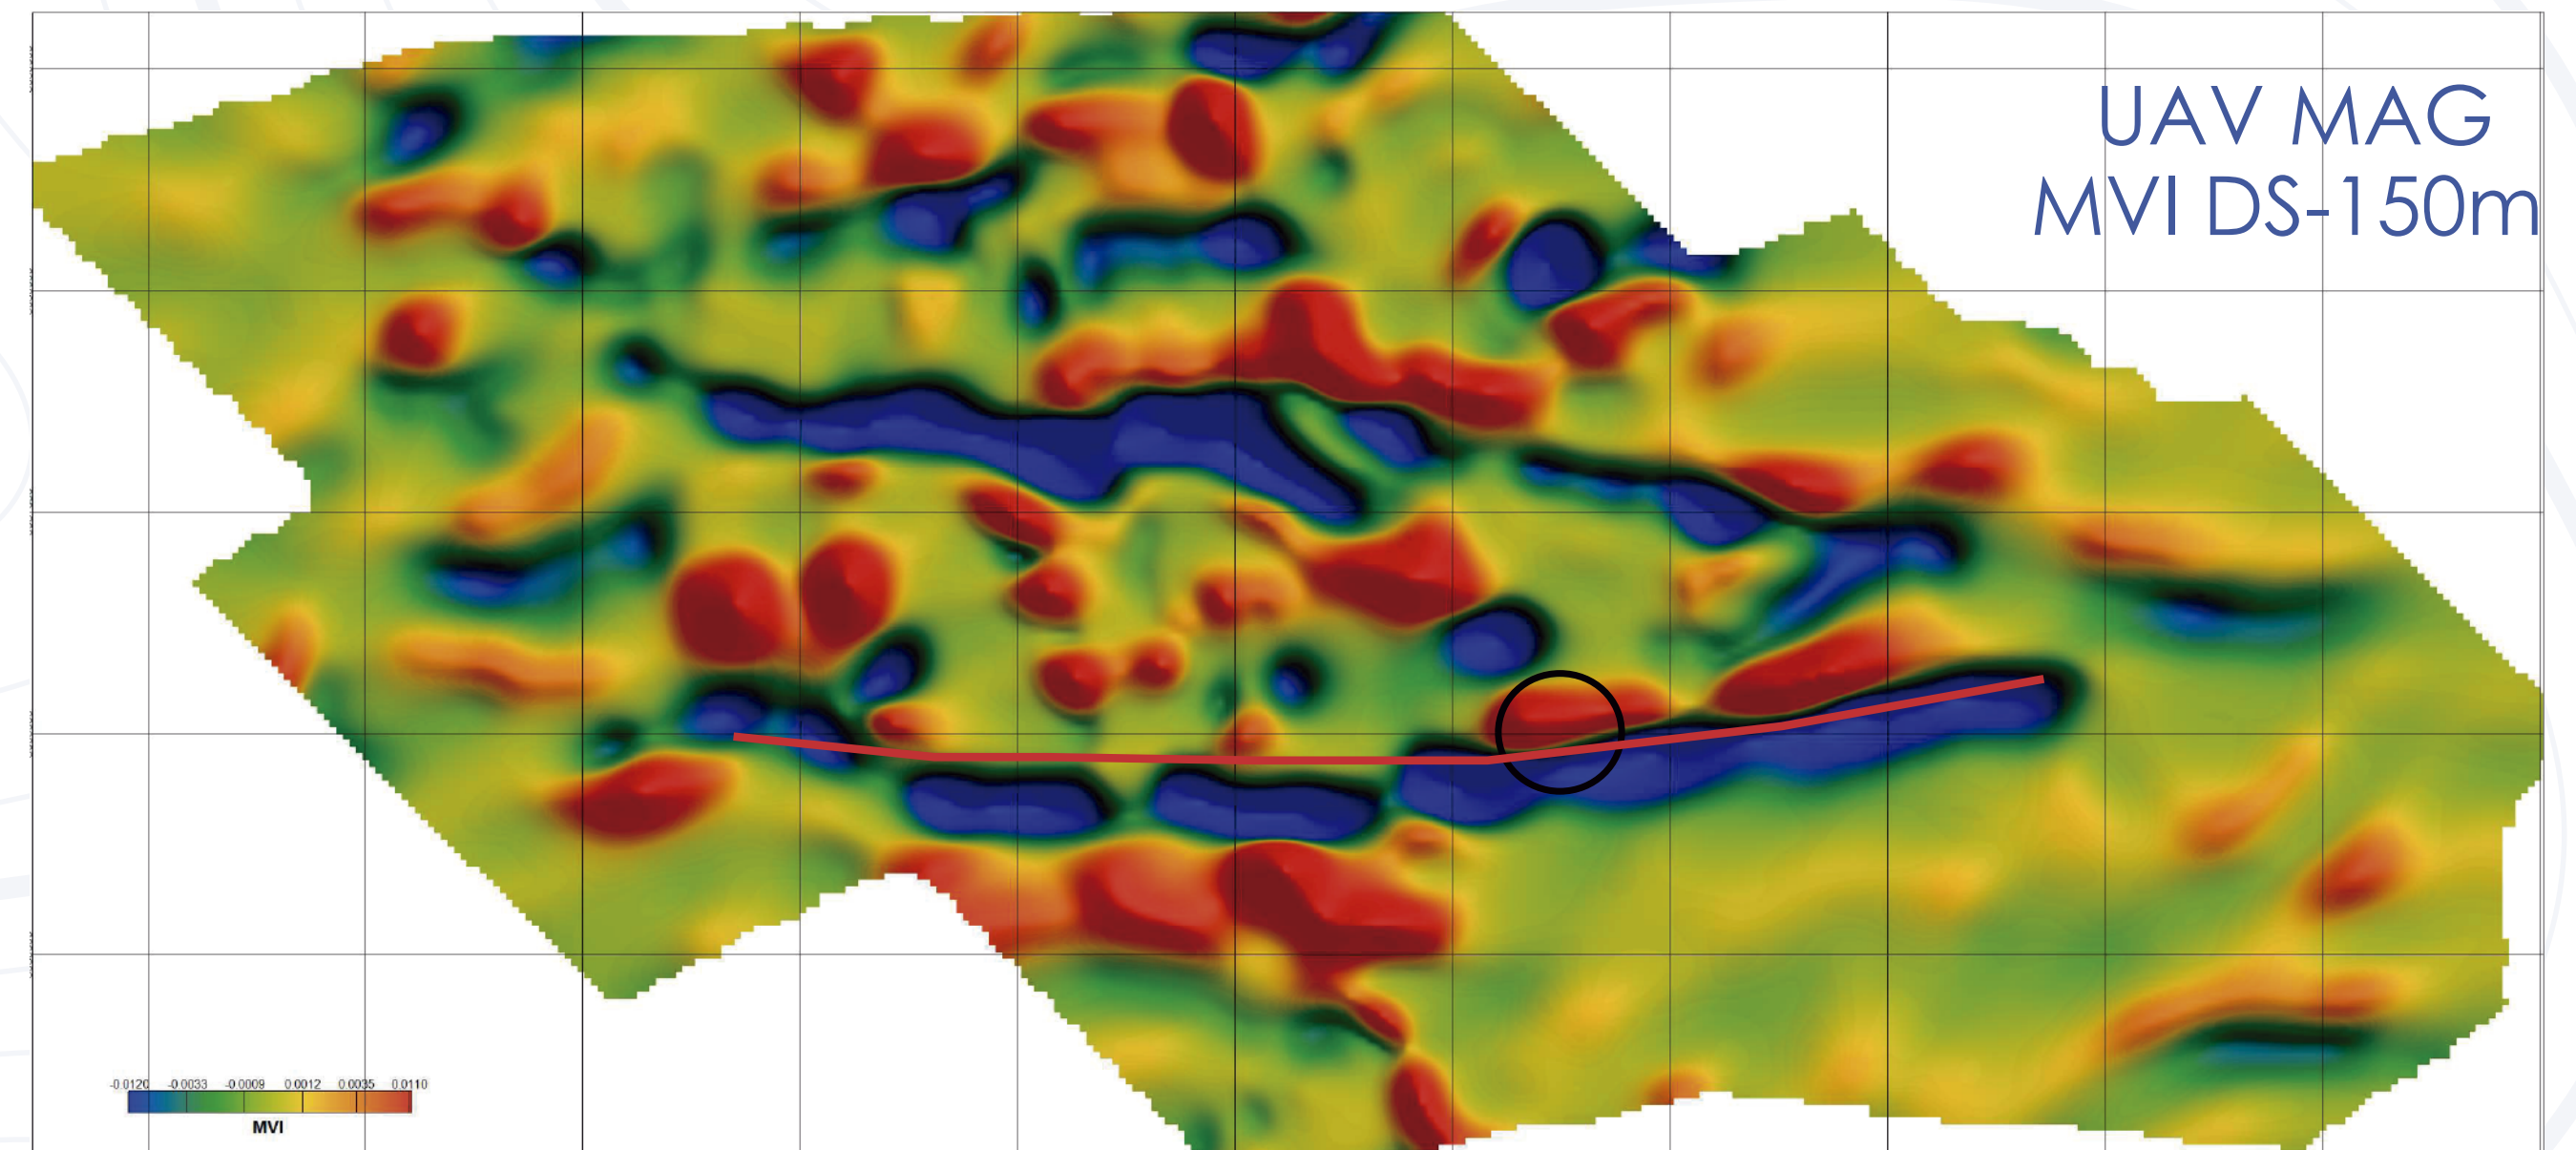

MAG + GRAV + IP/RES = MACHINE LEARNING TARGETING

MagNIMBUS atomic
total-field magnetometer

Applications and services: UAV Magnetometry

- Project of 10x5km at 4,500 masl, 3,500 linear kilometers, flight lines every 100m, and nominal flight height of 40m above the surface.
- Geophysical characterization through the identification of magnetic anomalies related to demagnetized mineralized structure in IS epithermal-type deposit.
- New exploration target to the north in a structure with similar characteristics.

IP Chargeability

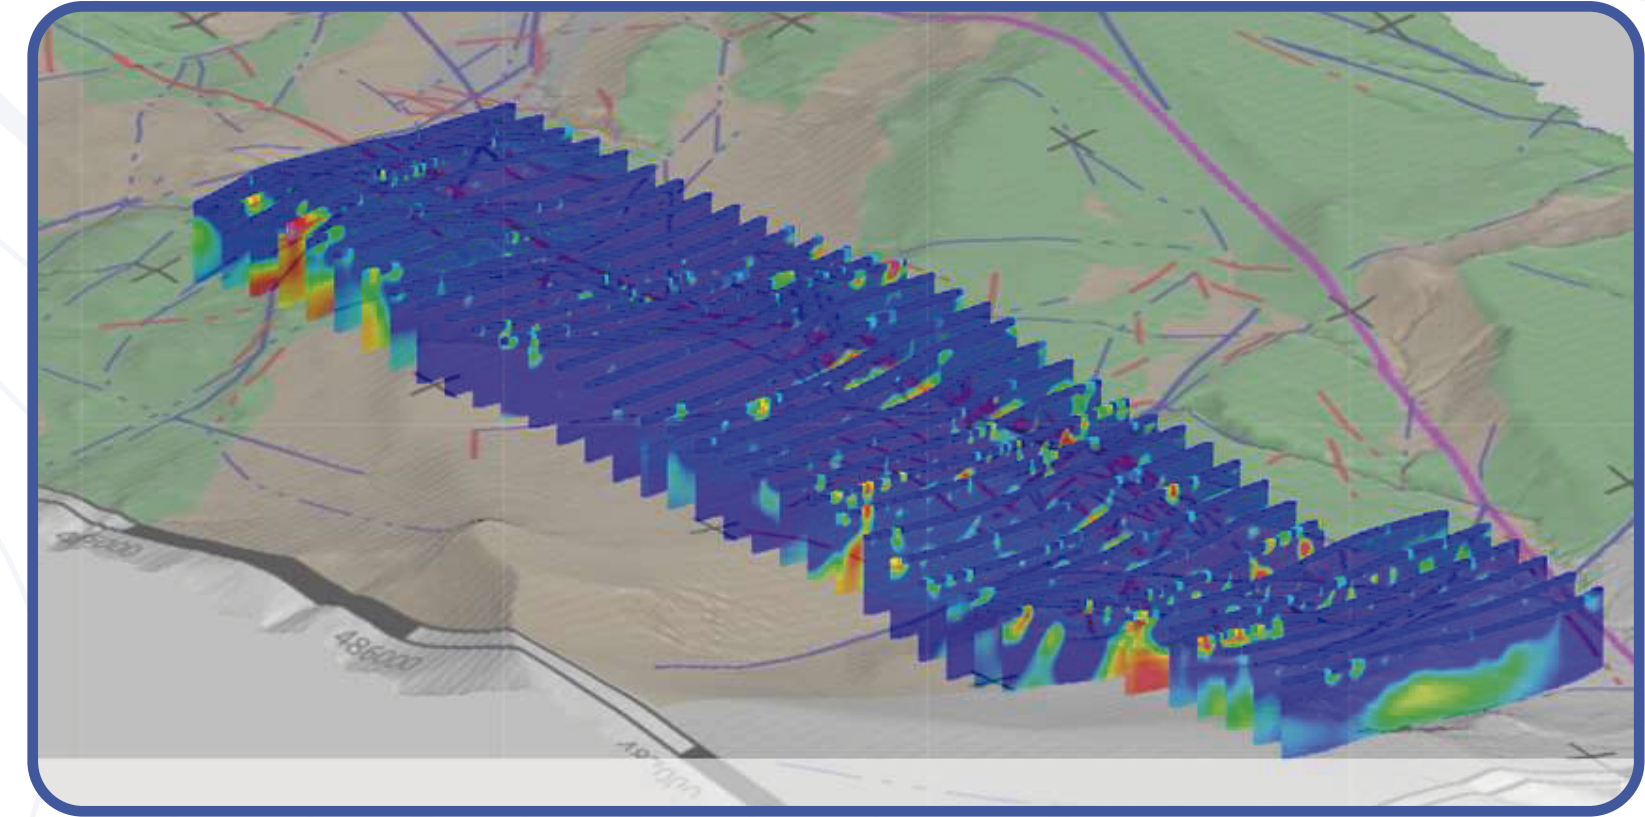

IP Resistivity

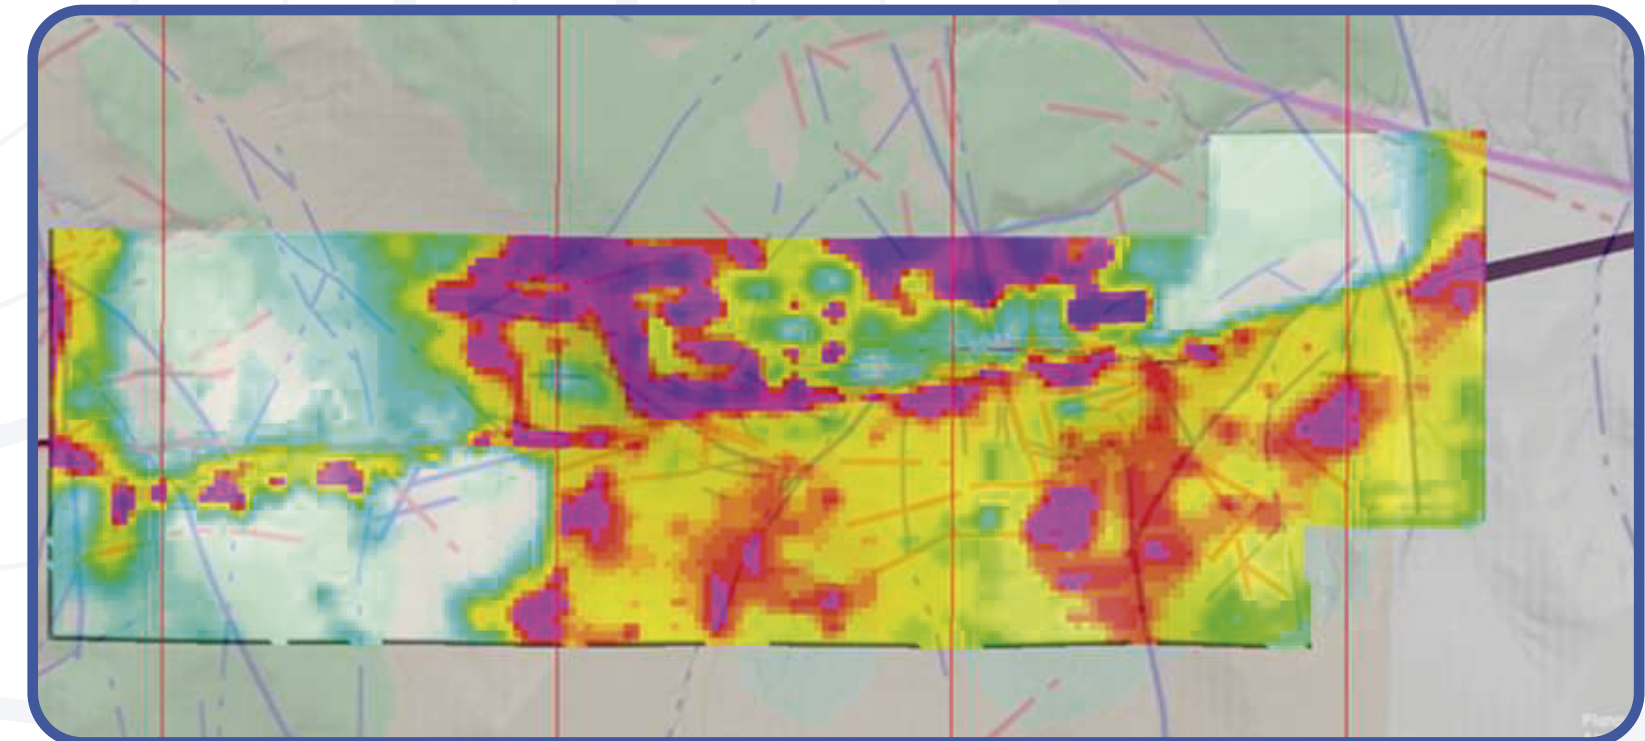

○ Mine
/ Vein

Applications and services: Electric resistivity and IP Tomography

- ▶ 2D-3D shallow mining exploration (<500m)
- ▶ Characterization of PC, IOCG, Epithermal, and Strata-Bound deposits.
- ▶ Evaluation of aquifer heterogeneity.
- ▶ Location of paleochannels, dykes, and other geological features.
- ▶ Detection of leaks in leach piles, dams, and reservoirs.
- ▶ Mapping and monitoring of pollution plumes.
- ▶ Study of time-lapse multitemporal infiltration in dams and environmental remediation monitoring.

High-density IP-Res: 38 lines of 48 electrodes spaced 100m

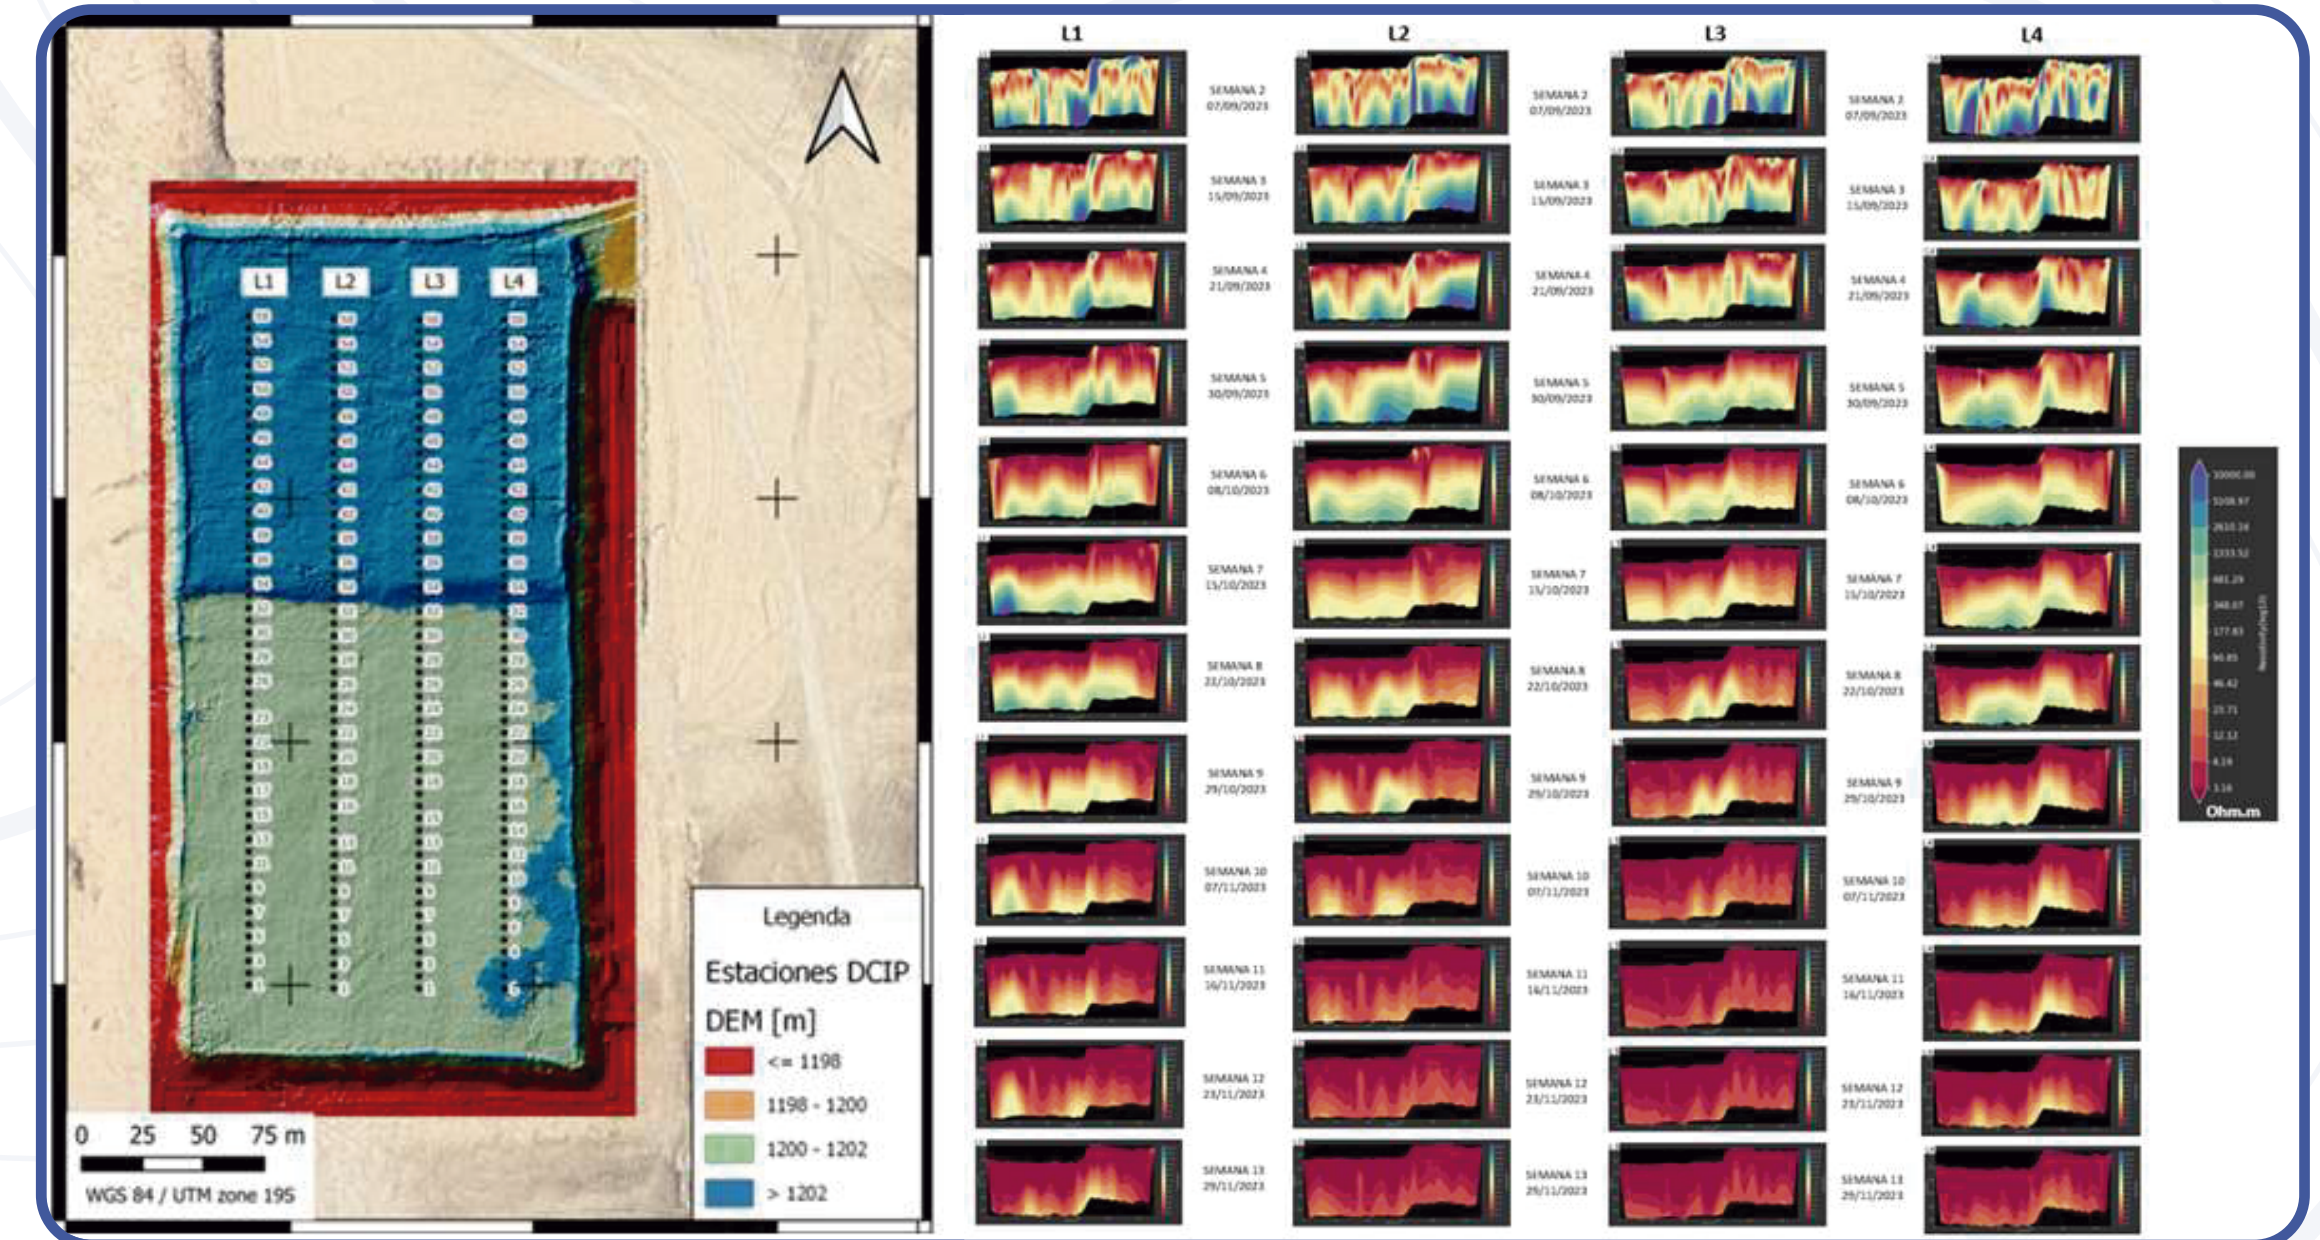

Resistivity Depth Slide identifying mineralized structure

Chargeability Depth Slide with sulfide anomalies

Applications and services: Electric resistivity and IP Tomography

Monitoring Irrigation Leaching Heap from week 1 to week 12 through resistivity measurement.

ARES II
10 Channels and
48 Electrodes

SUPERSTING
8 Channels and 56 Electrodes

Applications and services: Processing, Multiparameter Geophysical Integration, and Machine Learning

► 3D Inversion and Machine Learning:

- Definition of Exploratory Objectives.

► Reprocessing and Integration:

- Gravimetry.
- Magnetometry.
- Magnetotellurics.
- Seismic.
- IP/Res.
- Electromagnetics.

► Machine Learning:

- Proprietary algorithms and workflows
- Definition of Exploratory Objectives.
- Feedback and optimization with new data.
- Local and cloud processing capabilities allow for quick response.
- Self-Organizing Map (SOM) algorithm enables efficient prediction of new exploratory targets.

$$\text{IP} + \text{RES} + \text{MAG} + \text{GRAV} + \text{Geología} = \text{SOM}$$

○ Recognized mineralized body Identified by drilling

○ Untested targets

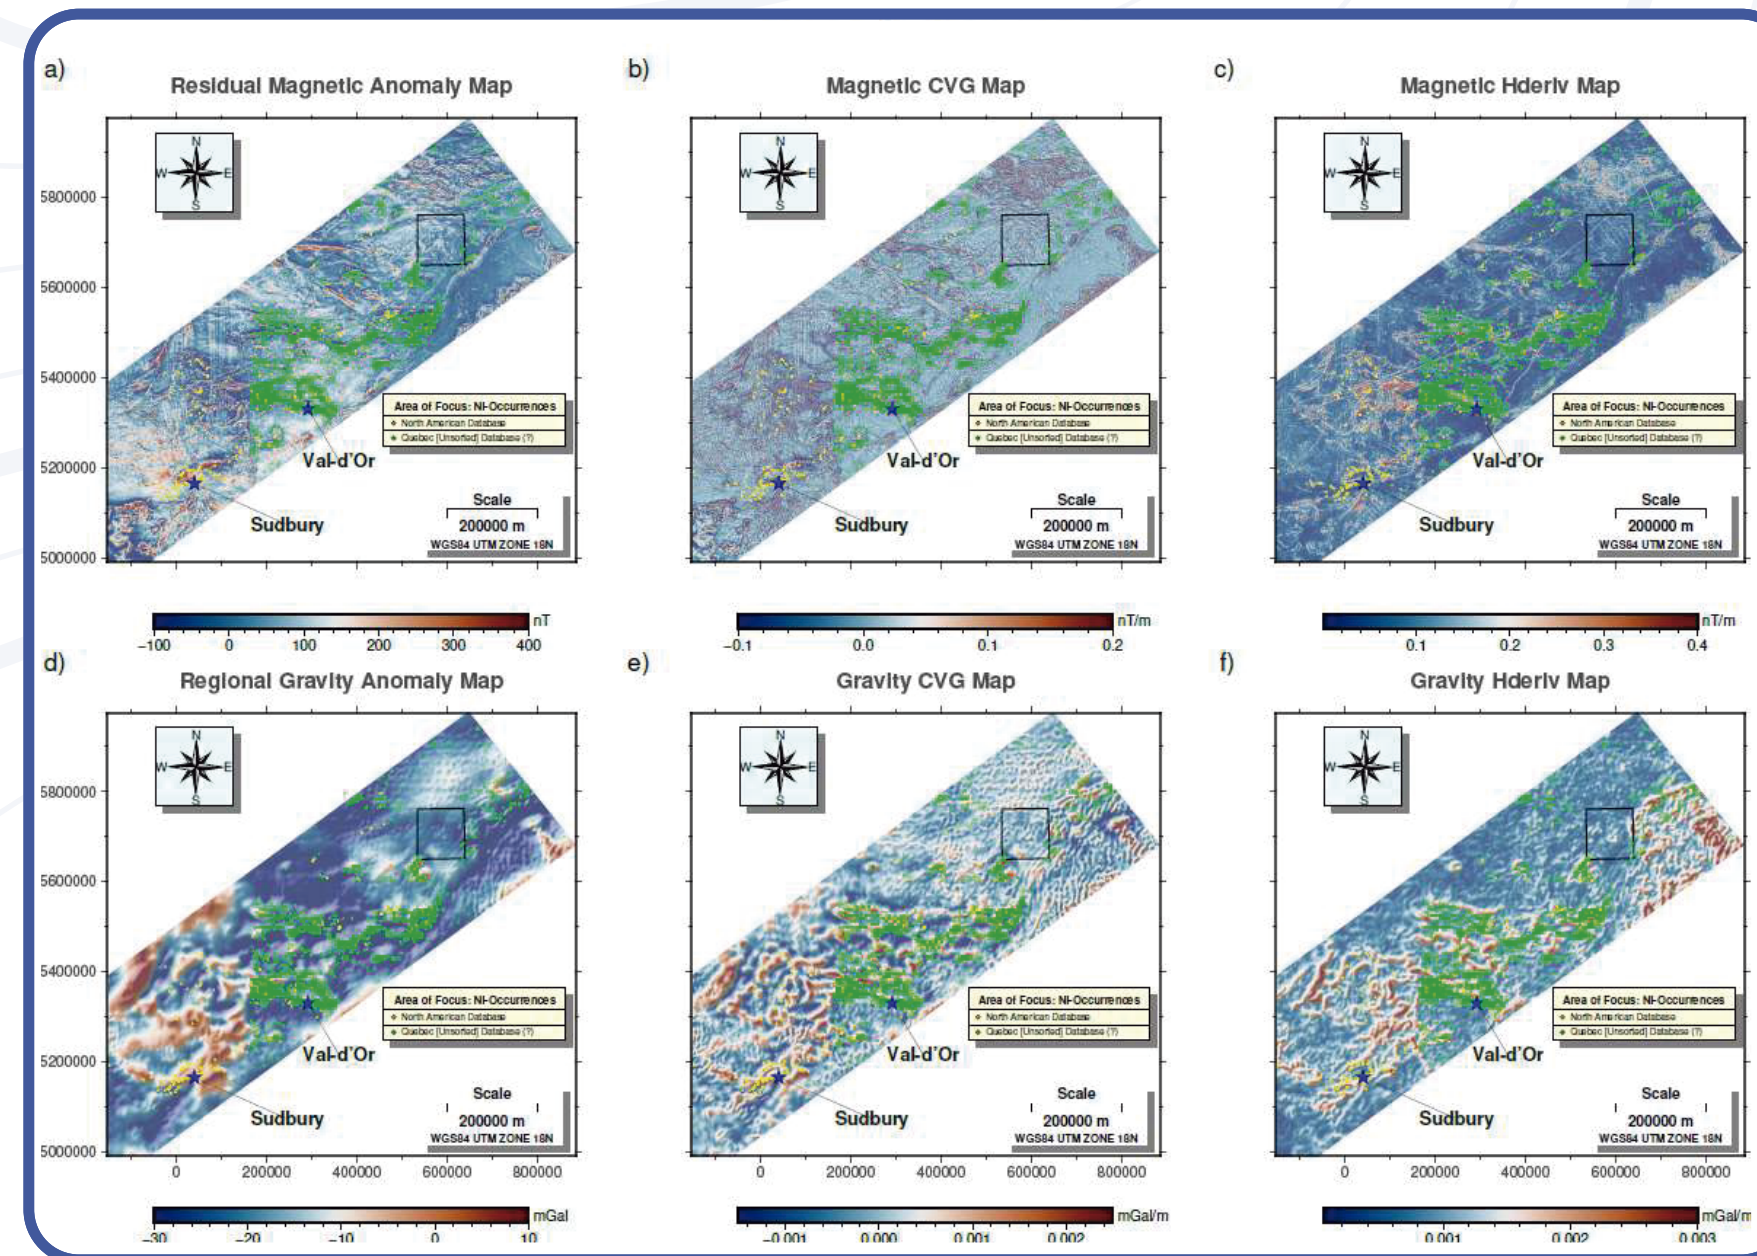

Machine Learning: Self-Organizing Map (SOM) algorithm on 3D inversion of Magnetic, Gravimetric, IP, and Resistivity data. Through machine learning, the SOM algorithm successfully predicts new exploration targets.

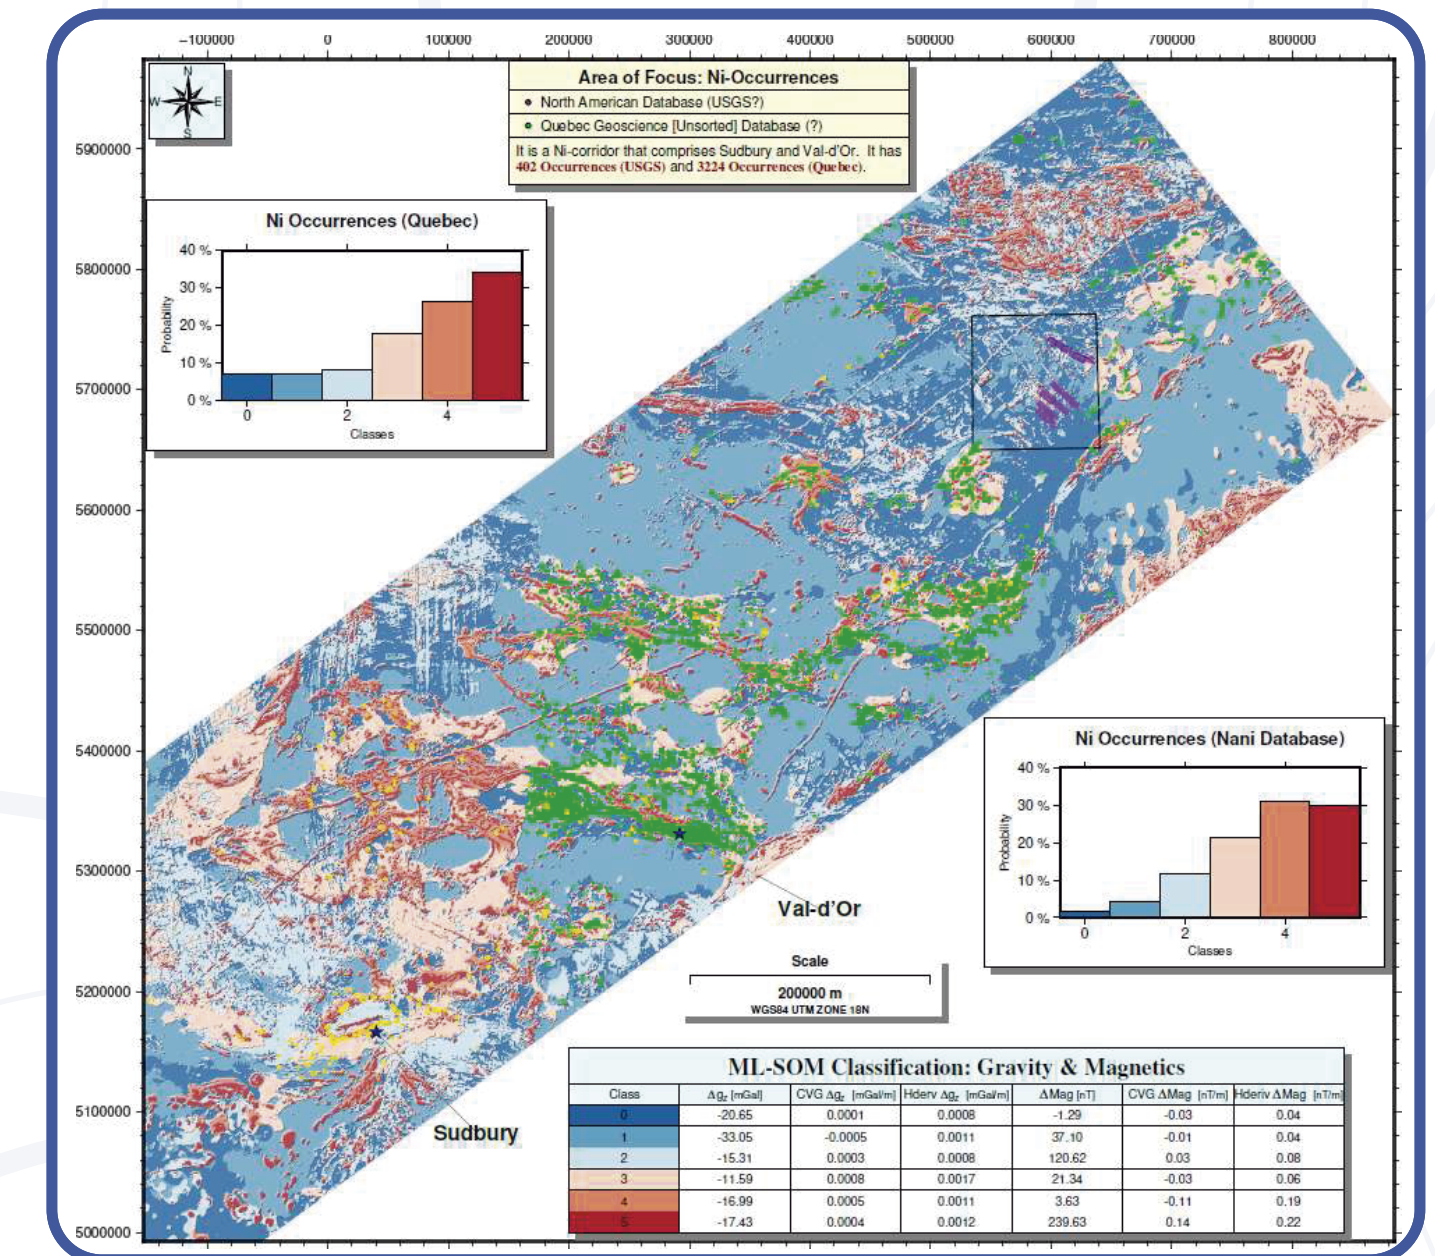

Applications and services: Processing, Multiparameter Geophysical Integration, and Machine Learning

- Compilation, organization, and standardization of local and regional geophysics.
- Machine Learning classification and characterization of geophysical maps.
- Prospectivity maps assisted by Machine Learning.

Geophysical Maps

ML-Assisted Characterization
